NOTES:

- The State Water Resources Control Board Division of Drinking Water (SWRCB DDW) allows Sacramento County Water Agency (SCWA) to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of our data, though representative, are more than one year old
- Southwest Tract (SWT) receives its water from Fruitridge Vista Water Company which changed its ownership to California American Water Company in March 2020. For questions regarding water quality on Southwest Tract, please call California American Customer Service at 1-(888) 237-1333
- The SWRCB DDW allows the measurement of gross alpha radiation as a surrogate for Uranium

4	Total Trihalomethanes are the sum of Fou	ur Regulated TTHMs	s, i.e., Chlorof	form, Bromod	lichloromethane	e, Dibromochloromethane, and Bromoform.

NOTES:

HAA6Bı

- Hardness units are PPM. General guidelines for classification of water hardness are: 0 - 60 PPM as soft: 61 - 120 PPM as moderately hard; 121 - 180 PPM as hard; and greater than 180 PPM as very hard.

2019 - 2020

PPB

The levels for Lead & Copper concentrations were obtained from the 90th percentile sampling of thirty-five (35) homes at the tap for Arden Park Vista (APV), eighteen (18) for Northgate (NOR) & five (5) for Southwest Tract (SWT). The MCLs for lead and copper are set at "Action Levels" (AL). None of the samples taken in APV, NOR or SWT exceeded the Action Level for Copper or Lead. Please refer to the educational information on Lead in drinking water.

Byproduct of drinking water disinfection.

Byproduct of drinking water disinfection

11 Unregulated Contaminants Monitoring Rule (UCMR 4 / 2018 - 2020 Monitoring) with notification levels help to determine where certain contaminants occur and whether they need to be regulated. The APV and NOR water systems were not required to sample for the UCMR4. For more information on the levels of unregulated contaminants found in SWT's system, please call California American Customer Service at 1-(888) 237-1333.

PER- & POLYFLUOROALKYL SUBSTANCES (PFAS) - See # 12

ne State Water Resources Control Board Division of Drinking Water (SWRCB DDW) established new drinking water guidelines for water agencies to follow in detecting and reporting the presence of perfluorooctanoic acid (PFOA) and PFOS were phased out in the 2000s due to health concerns, these chemicals were widely in grease and stain resistant coatings for consumer products and firefighting foams. Drinking water containing PFOA and PFOS has become an increasing concern due to the persistence of these chemicals in the environment ar ndency to accumulate in groundwater. Long-term exposure to PFOA and PFOS over certain levels is associated with adverse health effects that include cancer and developmental harm. SWRCB DDW has identified analytical methods capable of etecting the following eighteen (18) perfluorinated compounds in drinking water:

PERFLUOROBUTANE SULFONIC ACID (PFBS) PERFLUOROHEPTANOIC ACID (PFHpA) PERFLUOROHEXANE SULFONIC ACID (PFHxS) PERFLUORONONANOIC ACID (PFNA) PERFLUOROOCTYL SULFONIC ACID (PFOS) ERFLUOROOCTANOIC ACID (PFOA

N-ETHYL PERFLUOROOCTANESULFONAMIDOACETIC ACID (NEtFOSAA) N-METHYL PERFLUOROOCTANESULFONAMIDOACETIC ACID (NMeFOSAA) PERFLUORODECANOIC ACID (PFDA) PERFLUORODODECANOIC ACID (PFDoA) PERFLUOROHEXANOIC ACID (PFHxA) PERELLIOPOTETRADECANOIC ACID (PETA

PERFLUOROTRIDECANOIC ACID (PFTrDA) PERFLUOROUNDECANOIC ACID (PFUnA) HEXAFLUOROPROPYLENE OXIDE DIMER ACID (HFPO-DA) 9-CHLOROHEXADECAFLUORO-3-OXANONE-1 SULFONIC ACID (9CI-PF3ONS) 11-CHLOROEICOSAFLUORO-3-OXAUNDECANE-1-SULFONIC ACID (11CI-PF3OUdS)

NOTES:

- 12 In the 2nd Quarter of 2019 and 3rd Quarter of 2020, the SWRCB DDW directed SCWA to complete four quarters of sampling in the APV and NOR water system. SCWA tested for PFAS at groundwater wells near locations where the chemicals were believed to be especially prevalent. Apart from the required monitoring SCWA further tested for these chemicals at all water sources throughout the APV and NOR water systems. At one of the monitored wells, the analysis results returned with trace amounts of PFOA; however, all results are below the NLs and RLs for PFOA and PFOS. For more information on PFAS, PFOA and PFOS, please visit the SWRCB DDW's resource page: https://www.waterboards.ca.gov/drinking_water/PFOA_PFOS.html
- 13 The guidelines adopted by the SWRCB DDW set Notification Levels (NL) of 5.1 parts per trillion (PPT) for PFOA and 6.5 PPT for PFOS. If the NL is exceeded, the water agency (SCWA) is required to report the results to the Sacramento County Board of Supervisors and to the SWRCB DDW. The water agency is also urged to report this information to the customer
- 14 The SWRCB DDW established a Response Level (RL) of 10 PPT for PFOA and 40 PPT for PFOA and 40 PPT for PFOA and 40 PPT for PFOA. If the RL is exceeded in drinking water provided to consumers, the SWRCB DDW recommends that the water agency consider taking the water source out of service, provide treatment if that option is available, or provide

PARTS PER MILLION (PPM) OR MILLIGRAMS PER LITER (mg/L)

Parts per million (PPM) and milligrams per liter (mg/L) are units of measurement to determine the amount of a chemical in water. If we thought of each "part" or "milligram" as a second in a period of time, the following time frames would be an appropriate or accurate comparison:

1 milligram per liter (mg/L) or 1 part per million (PPM) =1 second in 11.5 days 1 microgram per liter (µg/L) or 1 part per billion (PPB)

1 nanogram per liter (ng/L) 1 picogram per liter (pg/L) or 1 part per trillion (PPT) 1 part per quadrillion (PPQ) =1 second in nearly 32 years =1 second in nearly 32,000 years =1 second in nearly 32,000,000 years

100% of the water for the Arden Park Vista and Northgate water systems comes from groundwater wells. Southwest Tract water is supplied by Cal-Am Water. For more detailed information regarding SCWA water quality, please call Aaron Wyley @ (916) 875-5815.

SACRAMENTO COUNTY WATER AGENCY

2020 WATER QUALITY REPORT - ARDEN PARK VISTA, NORTHGATE & SOUTHWEST TRACT

LEGEND:

MFL...Million Fibers Per Liter

NA...Not Analyzed

PPB...Parts per Billion (ug/l) PPM...Parts per Million (mg/l) TT...Treatment Technique

MPN...Most Probable Number

MO...Monitored Only

n/a...Not Applicable ND...Non-Detected NL...Notification Level

NTU...Nephelometric Turbidity Units PDWS...Primary Drinking Water Standard pCi/L...Pico Curies per Liter

PPT...Parts per Trillion (ng/l) RL....Response Level

WTP...Water Treatment Plant

Detection Limit for Reporting: The limit at or above which a contaminant is detected.

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency, Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use

Primary Drinking Water Standards (PDWS): MCLs, MRDLs and treatment techniques (TTs) for contaminants that affect health, along with their monitoring and reporting requirements

Public Health Goal (PHG). The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency

Range (Lo - Hi): The range between the lowest and highest values of a specific substance measured throughout the course of the year.

Regulatory Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Weighted Average (WTD AVG): An average of water quality samples in which each sample is assigned a weight. Each sample's contribution (or weight) is based on the amount of water the corresponding water source produces

for the whole system. Instead of each of the sample results contributing equally to the final average, some of the results contribute more than others.

ate Mandated Information for Nitrate, Arsenic & Lead:

Nitrate in drinking water at levels above 10 mg/L is a health risk for infants of less than six months of age. Such nitrate levels in drinking water can interfere with the capacity of the infant's blood to carry oxygen, resulting in a serious illness; symptoms include shortness of breath and blueness of the skin. Nitrate levels above 10 mg/L may also affect the ability of the blood to carry oxygen in other individuals, such as pregnant women and those with certain specific enzyme deficiencies. If you are caring for an infant, or you are pregnant, you should ask advice from your health care provider. Nitrate levels may rise quickly for short periods of time because of rainfall or agricultural activity.

While your drinking water meets the federal and state standard for arsenic, it does contain low levels of arsenic. The arsenic standard balances the current understanding of arsenic's possible health effects against the costs of removing arsenic from drinking water. The U.S. Environmental Protection Agency continues to research the health effects of low levels of arsenic, which is a mineral known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damage and circulatory problems

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Sacramento County Water Agency is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you do so, you may wish to collect the flushed water and reuse it for another beneficial purpose, such as watering plants. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/lead.

To help protect the quality of existing and future groundwater supplies, the Drinking Water Source Assessment and Protection (DWSAP) program calls for examining the vulnerability of drinking water sources to potential contamination. The Water Agency completed its latest comprehensive report in May 2019. The Water Agency's report identified the following potential contamination results:

Arden Park Vista & Northgate:

nercial types of activities such as the dry cleaning business, gas stations, a sewer collection system and a leaking underground storage tank, electronic manufacturers and photo processors

Central & South Service Area (CSA & SSA)

Most vulnerabe to activities including automobile-gas stations; boat services/ repair/ refinishing; chemical/ petroleum pipelines; dry cleaners; fleet/ truck/ bus terminal; grazing; historic waste dumps/ landfills; leaking underground storage tanks; other animal operations; pesticides/ fertilizer/ petroleum storage transfer areas; plastics/ synthetics producers; research laboratory; wells-agricultural/ irrigation types; wells-oil, gas, and geothermal types; wood preserving/ treating and sewer collection systems

Hood, East Walnut Grove and Delta Estates:

Most vulnerable to irrigated crops and septic systems.

North Service Area (NSA):

Most vulnerable to commercial types of activities such as grazing, known contaminant plumes, low-density septic systems, sewer collection systems and wells-agricultural irrigation types
